Cell Culture Models of Biological Barriers: In vitro Test ...

Over the past ten years several sophisticated in vitro test systems based on epithelial cell cultures have been introduced in the field of drug delivery. These models have been found to be very useful in characterizing the permeability of drugs across epithelial tissues, and in studying formulations or carrier systems for improved drug delivery and

Cell culture models of disease have provided not only versatility but also huge reductions in experimental cost and time, compared with previous whole animal and tissue model systems. Cell culture is the only reproducible, ethical human model system and is, therefore, of unprecedented importance in the study of human disease. Since the beginnings of cell culture in the late 19th century, key technological obstacles have been overcome to model human disease processes accurately in these ...

One of the challenges in respiratory research in general, and for COVID-19 related projects in particular, is to have access to relevant in vitro cell culture models. Human lung epithelium models are currently being tested as a platform for COVID-19 research and several cell types susceptible to SARS-CoV infection have already been identified.

Despite its imminent benefit for cell biological studies, suspicion and prejudice toward more complicated sample preparation requirements limited the popularity of 3D culture techniques until recently, when it was shown that soft 3D gels made of basement membrane extracts (BME) allow prolonged culture of many types of primary epithelial cells (Clevers H, Cell. 165:1586-1597, 2016; Sato T ...

Both cell models are 3D multi-cellular structures that better mimic the in vivo environment as compared to their 2D cell counterparts. Organoids typically consist of a co-culture of cells which demonstrate a higher order of self-assembly to allow for an even better representation of complex in vivo cell responses and

Cell culture is the process by which cells are grown under controlled conditions, generally outside their natural environment. After the cells of interest have been isolated from living tissue, they can subsequently be maintained under carefully controlled conditions. These conditions vary for each cell type, but generally consist of a suitable vessel with a substrate or medium that supplies ...

Organoids and spheroids are both cells cultured in 3 dimensions. Spheroids are often formed from cancer cell lines or tumor biopsies as freely floating cell aggregates in ultra-low attachment plates whereas organoids are derived from tissue stem cells embedded within an ECM hydrogel matrix such as Matrigel.

Two in vivo models for oral carcinogenesis, the 7,12 dimethylbenzo[*a*]anthracene-induced hamster cheek pouch model and the 4-nitroquinoline-N-oxide rat oral model, have been established in culture. Thus, multistage carcinogenesis models have been established from both human tissues and animal models and include cultures of normal, premalignant and malignant cells.

Cell cultures are used for in vitro assays or to produce biological compounds such as recombinant proteins or antibodies. In order to optimize cell growth, the culture medium is usually supplemented with blood stream or with a number of defined molecules.

Cell culture is one of the major tools used in cellular and molecular biology, providing excellent model systems for studying the normal physiology and biochemistry of cells (e.g., metabolic studies, aging), the effects of drugs and toxic compounds on the cells, and mutagenesis and carcinogenesis.

Historically, animal models have been used to test the toxicity and efficacy of cosmetics 1 and transdermal drug absorption. 2 Due to ethical concerns, however, these animal models have gradually been replaced by "cruelty-free" in vitro organotypic skin models that use primary human cells and cell culture inserts to recapitulate the stratified epidermal architecture. 3 In 2013, the ...

A 3D cell culture is an artificially created environment in which biological cells are permitted to grow or interact with their surroundings in all three dimensions. Unlike 2D environments (e.g. a Petri dish), a 3D cell culture allows cells in vitro to grow in all directions, similar to how they would in vivo. These three-dimensional cultures are usually grown in bioreactors, small capsules in ...

Embryonic development is a critical process for all organisms including humans. Many different diseases can arise when there are problems during development, but it can be extremely challenging to study the underlying physiological processes.
