Power system reliability indices In the beginning, the methods used were classical to evaluate reliability indices of distribution systems such as failure frequency, mean failure times, mean time between failure and energy not supplied. These indices help decision makers to define technical and management measures to perform systems.

maintenance of power systems. The reliability evaluation of a power system can be done using different methods. Due to complex and integrated nature of a power system, failures in any part of the system can cause interruptions. Evaluation of Reliability indices and solving of the Load flow analysis can be done using ETAP software.

Analysis Of System Reliability Using Markov Technique 5267 In the 4-Elements Markov Model, each element has two states - good and failed state. The states of the Model are generated based on the elements being in one of these two states. An element with constant failure rate has a transition Probability that is approximated by  $\lambda\Delta t$ .
